

lioil Studio

 lioil.Studio We make machines.

lioil.Studio is a creative studio founded in 2022, dedicated to creating innovative and high-quality products. With a talented and experienced team, lioil stands out with its creative approach and ability to turn ideas into tangible solutions for clients.

At lioil.Studio, we bring together a diverse team of specialists in microelectronics, computer programming and project management, as well as artists, craftsmen and experts in design and 3D printing. We are committed to providing flexible expertise to meet the needs of each project.

Our projects:

We are developing the Angry Machine for the Decroly Institute. It is an interactive sound and light machine for a public of difficult children. Its goal is to reinforce group cohesion while stimulating concentration and following instructions.

We created the Calm Machine with the same institute. This therapeutic and artistic device helps young autistic children to regain calm and learn the principles of causality.

We also supported the artist I Am A Vowel in the creation of his musical project Waouh Machine. This project involved a tangible and random music album. We participated in the design and implementation of this project with the artist.

lioil.Studio was born from the collaboration between Nelly Larguer, a multimedia artist specialized in sound and 3D design and Guilhem Gayraud, an expert in microelectronics, computer science and project management. Their complementary skills allow them to provide custom solutions in the design and manufacture of machines combining technicality and aesthetics.

We create the machines of your dreams!
Do not hesitate to contact us to bring your boldest desires to life.
